Flare Fireplaces FAQ | Liquid Propane Operation and Burner

Though there are certain limitations to Liquid Propane when compared to the usage of natural gas, Flare Fireplaces does offer the ability to run your fireplace with a regulated Liquid Propane tank. Liquid Propane burns more hotter and more efficiently than Natural Gas, to accommodate this increase in heat we must use smaller orifices to achieve a lower BTU, causing your flame to appear smaller than on a unit run with Natural Gas. Flame height on fireplaces using Liquid Propane is typically 4-6" because of this adjustment. In situations where a fireplace is ordered with Liquid Propane we will ship an advanced 3D-Burner equipped with adjustable leaves used to cover burner ports. Helping protect media placed over the burner from sooting, and in certain situations, increasing overall flame height

See LP Burner specific information below:
